Q4.

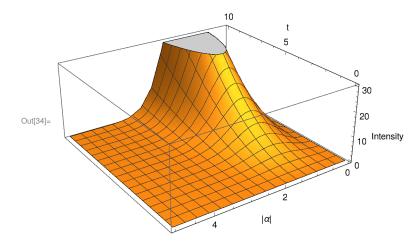

Solving the summation $(a=|\alpha|)$:

$$\ln[1]:= Sum \left[\frac{a^{2n}}{(n!)^2} n, \{n, 1, \infty\} \right]$$

Out[1]= a BesselI[1, 2 a]

c) Taking
$$\frac{|G|^2}{\hbar^2} = 1$$

$$\begin{array}{ll} & \text{In}[34]:= & \text{Plot} 3D \left[\text{t}^2 \text{ a BesselI} \left[1, 2 \text{ a} \right] \text{ Exp} \left[-\text{a}^2 \right], \left\{ \text{t}, 0, 10 \right\}, \\ & \left\{ \text{a}, 0, 5 \right\}, \text{ AxesLabel} \rightarrow \left\{ \text{"t", "} |\alpha| \text{", "Intensity"} \right\} \right] \end{array}$$

For $|\alpha|>4$ or $|\alpha|<0.01$ we have the number of particles in the excited state to neglegably small. Additionally, if you increase $|\alpha|$, we get the intensity approaching zero. Hence Rabi oscillations will be too small to see,
